a processor configured to:

receive at the first display surface a user input to move a graphical user interface element displayed at the first display surface;

determine that at least a portion of the graphical user interface element is to be moved beyond an edge of the first display surface into the gap such that the at least a portion of the graphical user interface element will not be displayed at the first display surface; and

display the at least a portion of the graphical user interface element at the second display surface at a time based on a location and a direction of movement of the graphical user interface element at the first display surface.

13. The electronic device of claim **12**, the user input includes a drag operation of the graphical user element at a touch screen at the first display surface.

14. The electronic device of claim **12**, wherein the processor is further configured to:

determine that the at least a portion of the graphical user interface element is to be moved away from the gap; and

stop display of the at least a portion of the graphical user interface element at the second display surface.

15. The electronic device of claim **12**, wherein a width of the at least a portion of the graphical user element is substantially equal to a width of the gap.

16. The electronic device of claim **12**, wherein a width of the at least a portion of the graphical user element is less than a width of the gap.

17. The electronic device of claim **12**, wherein the first panel and the second panel are each rotatably coupled to a hinge located between the first panel and the second panel.

18. The electronic device of claim **17**, where a width of the gap is substantially equal to a width of the hinge.

19. An apparatus comprising:

means for receiving at a first display surface of an electronic device a user input to move a graphical user interface element displayed at the first display surface, the electronic device further including a second display surface that is separated from the first display surface by a gap;

means for determining that at least a portion of the graphical user interface element is to be moved beyond an edge of the first display surface into the gap such that the at least a portion of the graphical user interface element will not be displayed at the first display surface; and

means for displaying the at least a portion of the graphical user interface element at the second display surface based on a location and a direction of movement of the graphical user interface element at the first display surface.

20. The apparatus of claim **19**, wherein the user input includes a drag operation of the graphical user element at a touch screen at the first display surface.

21. The apparatus of claim **19**, further comprising:

means for determining that the at least a portion of the graphical user interface element is to be moved away from the gap; and

means for stopping display of the at least a portion of the graphical user interface element at the second display surface.

22. A computer readable medium storing computer executable code comprising:

code for receiving at a first display surface of an electronic device a user input to move a graphical user interface element displayed at the first display surface, the electronic device further including a second display surface that is separated from the first display surface by a gap;

code for determining that at least a portion of the graphical user interface element is to be beyond off an edge of the first display surface into the gap such that the at least a portion of the graphical user interface element will not be displayed at the first display surface; and

code for displaying the at least a portion of the graphical user interface element at the second display surface based on a location and a direction of movement of the graphical user interface element at the first display surface.

23. The computer readable medium of claim **22**, wherein the user input includes a drag operation of the graphical user element at a touch screen at the first display surface.

24. The computer readable medium of claim **22**, further storing computer executable code comprising:

code for determining that the at least a portion of the graphical user interface element is to be moved away from the gap; and

code for stopping display of the at least a portion of the graphical user interface element at the second display surface.
